

## Coding Exercise

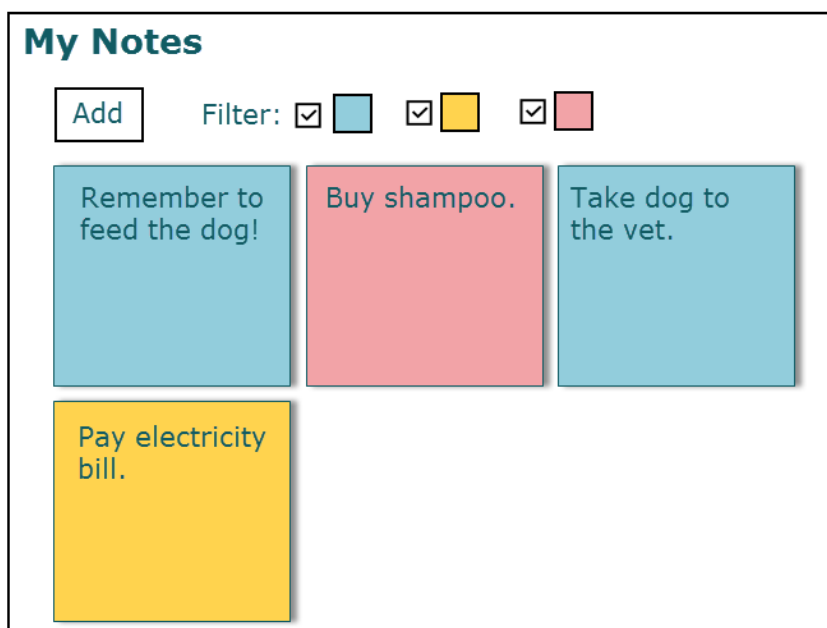

Write a simple 'Notes' application which lets a user add notes for reminders.

- It should be a single page web application using either Angular or React.
- You may style the application as you wish, so that it looks similar to the design below.
- Add one extra feature to the application that you think a user will find useful.

Please upload your solution to GitHub with a README file that explains how to build and run your application. Also, include an explanation of the extra feature that you added.

Please provide us with the link to your GitHub solution once you are finished.

## Requirements

- Notes are sorted in the order that they are added.
- The filter enables the user to show and hide notes based on their colour.
- When the 'Add' button is clicked a modal popup window should appear to let the user add a note which appears on the screen after the user clicks save.
